# GUI Mockup

A GUI Mock-Up was created and annotated by Jessica. We discussed how we wanted the system to be laid out and Jessica visualised it. We used this mock-up to create things like flow diagrams, guide research into Tkinter and SQLite and it helped me design the realistic mock-up in Visual Studio.

I created this realistic mock-up to give our team a better idea of what our program will look like on a computer.

Although our system will be created in Python, I used C# Windows Forms to create this as it was a quick and easy way to visualise our future plans.

Team Collaboration

Our team has used GitHub as the central for each and every file we individually create. It's allowed us to seamlessly collaborate without having to fumble around with sending files.

Trello has helped with our groups productivity. We have used a Trello board to monitor what needs to be done and what we have completed.

Discord has been our main form of communication while completing our group project. We have organised weekly meetings to discuss tasks needing to be completed all via Discord.
